07)	Let, $f(x) = \frac{1}{\sqrt{x+2}}$; $x \ge -2$ and $g(x) = 2x + 1$
	(i) Find the domain of the function $\frac{f}{g}$
	(ii) Obtain the value of $\left(\frac{f}{g}\right)$ (0)
08)	Show that $a > \frac{11}{9}$, if both roots of the equation $x^2 - 6ax + 2 - 2a + 9a^2 = 0$ are greater than
	three.

09)	If, $\sec \theta + \tan \theta = P$, deduce that $\tan \theta = \frac{P^2 - 1}{2P}$. Here P is a non-zero real constant.
10)	Solve, $sin^{-1}\left(\frac{5}{x}\right) + sin^{-1}\left(\frac{12}{x}\right) = \frac{\pi}{2}$.

Combined Mathematics 12 - I (Part - B)

Answer only five questions.

- a) Let $f(x) = x^4 + Px^2 + r$. Find p and r if f(1) = -9 and f(0) = -8. Find the values of the real 11) constants a, b and c, if f(x) can be expressed in the form $(ax^2 + b)^2 + c$. Here a > 0. Hence find the real roots of f(x) = 0.
 - b) Find the range of values of P, for the expression $(p-1)x^2 4x + p 1$ to be positive for all real values of x.
 - c) If, α, β are the roots of $ax^2 + bx + c = 0$, find the roots of $cx^2 2bx + 4a = 0$ in terms of α, β .
 - d) Separate $\frac{x^2-1}{x^2(2x+1)}$ in to partial fractions.
- 12) a) Sketch the graphs of y = 2|x + 1| - 3 and y = x + 2|x - 1| in the same diagram. Hence solve the equation x + 2|x - 1| = 2|x + 1| - 3. Find the set of value of x, satisfying the inequality x + 2|x - 1| > 2|x + 1| - 3.
 - Let $a = \log_{2n} n$, $b = \log_{3n} 2n$ and $C = \log_{4n} 3n$, for a positive real number n. Prove that 1 + abc = 2bc.
 - c) If $a^x = b^y = c^z = d^w$, obtain that $x\left(\frac{1}{v} + \frac{1}{z} + \frac{1}{w}\right) = \log_a bcd$.
- 13)

a)
$$f: \mathcal{R} \to \mathcal{R}$$
 is defined as follows,

$$f(x) = \begin{cases} -x^4 + 4; & x < 1 \\ -2x; & x \ge 1 \end{cases}$$

- (i) Draw the rough sketch of f(x).
- (ii) Evaluate $\lim_{x \to 1^{-}} f(x)$ and $\lim_{x \to 1^{+}} f(x)$ (iii) Is the function continuous at x = 1? Justify the answer.
- (iv) Find $\lim_{x\to 1} f(x)$, if exists.
- Prove that $\lim_{\theta \to 0} \frac{\sin \theta}{\theta} = 1$ Evaluate the following limits.

(i)
$$\lim_{x \to 3} \frac{\sqrt{2x-1} - \sqrt{5}}{\sin(x-3)}$$

(ii)
$$\lim_{x \to 0} \frac{(\sqrt{4+x^2}-2) (1-\cos 2x)}{x^4}$$

- 14) a) Write the conditions which should be satisfied for the roots of the equation $ax^2 + bx + c = 0$ to be real and positive. Here $a, b, c \in \mathcal{R}$ and $a \neq 0$.

 When those conditions are satisfied show also that the roots of the equation $a^2x^2 + a(3b 2c)x + (2b c)(b c) + ac = 0$ are real and positive. If the roots of the second quadratic equation are α and β , using a suitable linear transformation, obtain the quadratic equation with roots $\frac{1}{\alpha}$ and $\frac{1}{\beta}$.
 - b) (i) Find k, if the distance between the two points (k, 2) and (3,4) is 8 units.
 - (ii) Find the coordinates of the remaining vertex, if (1,0), (6,1) and (5,6) are the vertices of a square separately.
 - (iii) In the triangle ABC, let A = (1,3) and B = (5,3). Find the coordinates of C, if the coordinates of the centroid of the triangle ABC is $\left(\frac{10}{3}, 4\right)$.
- 15) a) State and prove the factor theorem. If the polynomial $f(x) = x^4 + ax^3 + bx + c$ is divisible by (x 1)(x + 1)(x 2), find a, b, and c and find the remaining factors. Also find the solutions of $2f(x + 1) = x^2 + x 2$.
 - b) Separate the rational function $\frac{x^2}{(x-a)(x-b)}$ in to partial fractions in terms of a and b. Hence obtain the partial fractions of $\frac{4x^2}{4x^2-1}$.
 - the partial fractions of $\frac{4x^2}{4x^2-1}$. c) Evaluate $\lim_{x \to \infty} (\sqrt{x^2 + ax + a^2} - \sqrt{x^2 + a^2})$
- 16) a) Using the expression for $\sin(A+B)$, show that $\sin\left(\frac{5\pi}{12}\right) = \frac{\sqrt{6} + \sqrt{2}}{4}$. Hence deduce that, $\cos\left(\frac{5\pi}{6}\right) = -\frac{\sqrt{3}}{2}$.
 - b) If $\alpha + \beta \gamma = \pi$, Prove that $\sin^2 \alpha + \sin^2 \beta \sin^2 \gamma = 2 \sin \alpha \sin \beta \cos \gamma$.
 - c) Find the general solutions of the equation $2 \cos^2 x + \sqrt{3} \sin x + 1 = 0$.
 - d) Obtain that $\tan^{-1}\left(\frac{1}{2}\right) + \tan^{-1}\left(\frac{1}{3}\right) = \frac{\pi}{4}$
- 17) State the sine rule for a triangle *ABC*
 - a) Prove that, $\frac{a^2 + b^2}{a^2 + c^2} = \frac{1 + \cos{(A B)}\cos{C}}{1 + \cos{(A C)}\cos{B}}$
 - b) In the triangle ABC, the mid point of the side BC is D. According to the standard notation, show that $AD = \frac{\sqrt{2b^2 + 2c^2 a^2}}{2}$,

If
$$B\hat{A}D = \beta$$
, show that $\sin \beta = \frac{a \sin B}{\sqrt{2b^2 + 2c^2 - a^2}}$

If
$$A\widehat{D}C = \theta$$
, show that $\sin \theta = \frac{2b \sin C}{\sqrt{2b^2 + 2c^2 - a^2}}$

Combined Mathematics 12 - II (Part B)

Answer five questions only.

- 11) a) A train passes a station A at $40 \, kmh^{-1}$ and maintain this speed for 7km and is then uniformly retarded, stopping at B, which is $8.5 \, km$ from A. A second train starts from A at the instant the first train passes A and being accelerated for part of the journey and uniformly retarded for the rest, stops at B at the same time as the first train.
 - (i) Find the total time for the journey.
 - (ii) What is the greatest speed obtained by the second train?
 - b) A motor car X starts from rest at t=0, moves with uniform acceleration. At t=T, another motor car Y starts at the same point with velocity u and moves with an uniform retardation of 2f. If the motor cars meet each other, show that, $2fT(u+fT) = u^2$.
- a) Using the law of addition of vectors, show that the sum and difference of two vectors <u>a</u> and <u>b</u> gives by the diagonals of the parallelogram. If the sum of two unit vectors is an unit vector, show that the magnitude of their difference is √3.
 c) The position vectors of the points A, B and C relative to the origin O are 4<u>i</u> + 2<u>j</u>, <u>i</u> + <u>j</u> and (k + 1) <u>i</u> + 6<u>j</u> respectively. Find the value of k (k < 0) such that ABC = 45⁰.
 - c) In the parallelogram OACB, D and E are two points on BC and AC such that BD:DC=1:2 and AE:EC=2:1. F is the intersection point of OD and BE. The position vectors of A and B reative to O are \underline{a} and \underline{b} respectively. Show that $\overrightarrow{OF} = \frac{3}{10} \left(\underline{a} + 3\underline{b} \right)$. If OB and CF intersect at P, find the ratio OP:PB.
- 13) a) OAB is an equilateral triangle of length of a side 2a C is the mid point of OA. The forces 4P,P and P act along the sides OB, BA and AO in the direction of the letters respectively. Taking OA and OY (Parallel to CB) as X and Y axes respectively, express each force in the form xi + yj. Here i and j are unit vectors along OX, OY respectively. Show that the system of forces can be reduced to a single force 3P.
 Also show that the above single force can be reduced to a couple of moment 2√3 ap and to a like parallel force acting along the centre of the triangle.
 - b) The points 0, A, B and C are (0,0) (2,0) (2,1), and (0,1) respectively. The forces P, Q, R at along the sides OA, AB, BC respectively. If the resultant force of this system of forces lies on x + 2y = 7, find
 - i) The resultant force in terms of P.
 - ii) The moment of the couple such that the resultant lies on the line x + 2y = 9.

- 14) a) The position vectors of the points A and B relative to a fixed point O are \underline{a} and \underline{b} respectively. The points C and D lie on the OB and OA such that OC:CB=5:2 and OD:DA=3:2. The lines AC and BD interest at E. Show that $\overrightarrow{OE}=\underline{b}+\lambda\left[\frac{3}{5}\,\underline{a}-\underline{b}\right]$. Here λ is a constant. Obtain a similar expression for \overrightarrow{OE} . Here find the position vector of the point E in terms of \underline{a} and \underline{b} .
 - b) The position vectors of the points A, B, C relative to a point O are \underline{a} , \underline{b} and \underline{c} respectively. The point P lies on the line BC and it is given that $\overrightarrow{PC} = \frac{1}{10} \overrightarrow{BC}$.
 - (i) Find \overrightarrow{OP} in terms of \underline{b} and \underline{c} .
 - (ii) If it is given that AP and BC are perpendicular to each other show that,

$$(9\underline{c} + \underline{b}).(\underline{c} - \underline{b}) = 10\underline{a}.(\underline{c} - \underline{b})$$

- C) Hence or otherwise prove that $(3\underline{c} \underline{b}) \cdot (3\underline{c} + \underline{b}) = 0$, if OA, OB and OC are perpendicular to each other.
- 15) a) The mid points of the sides AB, BC, CD and DA of the rectangle are respectively P, Q, R and S respectively. Here AB = 6a and $BC = 2\sqrt{3}a$. Six forces of magnitudes 15N, λN , 5N, 10N, μN and $30\sqrt{3}$ N act along the sides PQ, QR, RS, SP, AD and CD respectively in the diection incicated by the order of the letters. Show that,
 - (i) This system of forces cannot be in equilibrium.
 - (ii) If this system of forces reduces to a couple, then $\lambda = -40$ and $\mu = 20$
 - (iii) $\lambda = -40$ and $\mu = 30$, if the system reduces to a force of 10 N, acting along the direction AD.
 - b) A string of length 2m is attached to two pints A and B 1m apart in the same level. A smooth ring of weight 10N is suspended by the string and it is kept in equilibrium vertically below B, by applying a horizontal force P on the ring. Find the tension in the string and the magnitude of the force P.
- In the rectangle ABCD, AB = 4cm and BC = 3m. The forces of magnitudes 8,7,3,2,8,7 Newtons act along the sides \overrightarrow{AB} , \overrightarrow{BC} , \overrightarrow{CD} , \overrightarrow{DA} , \overrightarrow{AC} and \overrightarrow{DB} respectively. Find the horizontal and vertical coponents of the resultant R. Hence find the distance from A, to the point which the line of action of the resultant cut AB.

 Now a couple of forces of 9Nm is added to the system in the sense ABCD. Show that the line of action of the new resultant cut the side AB at a distance 2m from A.
 - b) State the lami's theorem for the equilibrium of three coplanar forces acting at a point. A string ABCD attached to the two fixed points A and D on the same horizontal level supports two weights W_1 and W_2 at B and C respectively. In the equilibrium position, B is above C and the parts AB, BC and CD of the string inclined at acute angles α , β , γ to the verticle respectively.

Show that
$$\frac{W_1}{W_2} = \frac{\sin \gamma \sin (\beta - \alpha)}{\sin \alpha \sin (\beta + \gamma)}$$
.

- 17) a) A particle starts its motion with initial velocity u and moves with uniform acceleration a for a time t and obtains a final velocity v at a displacement of s. Using the velocity time graph for the motion of the particle, derive the equations of motion v = u + at, $S = \left(\frac{u+v}{2}\right)t$, $s = ut + \frac{1}{2}at^2$ and $v^2 = u^2 + 2as$.
 - b) A particle is projected vertically upwards with a velocity $u\ ms^{-1}$ and after t seconds another particle is projected vertically upwards from the same point with the same velocity. Prove that,
 - (i) they meet after a time $\left(\frac{t}{2} + \frac{u}{g}\right)$ from the first projection.
 - (ii) Particles meet at a height $\frac{4u^2 g^2t^2}{8g}$.
 - c) From a tap drops of water fall within equal time intervals. When one drop of water falls, earlier drop has travelled a distance of $\frac{1}{4}$ m when the distance between the two drops has increased to $\frac{3}{4}$ m, find the distance travelled downwards by the first drop. ($g = 10 \ ms^{-2}$)
